Overview

The most basic arrangement for an emergency or standby power system is shown in figure 1. This can be recognized as an extension of the single-source radial system, with the transformer omitted. The transfer switch transfers the emergency / standby loads to the alternate source upon failure of the normal source. This. The basic arrangement from figure 1 may be extended to the other system arrangements. For example, the secondary-selective system could be equipped with an emergency system as shown in figure 2: In figure 2, the emergency / standby load. An automatic transfer switch is defined as "self-acting equipment for transferring one or more load conductor connections from one power source to another". The automatic transfer switch is. NFPA 99 and the NEC have very unique requirements for the design of a hospital emergency system. The emergency system is classified into.
