

Principle of Trough Solar Power Generation System

Overview

A parabolic trough collector is a type of solar energy system that uses curved mirrors shaped like a parabola to focus sunlight onto a long receiver tube. This tube runs along the focal line of the mirror and contains a heat transfer fluid (usually oil or molten salt). A heat transfer fluid inside the tube is heated. Trough solar energy refers to a method of harnessing solar power using parabolic troughs as collectors. Produce heat in a working fluid, 3. Generate steam to power turbines, 4. This technology is efficient for large-scale energy. The 510 MW CSP project at Ouarzazate in Morocco, NOOR I,II,II comprises both forms of CSP. The fluid temperatures inside. The largest operational trough system - California's Solar Energy Generating Stations - has produced over 12 terawatt-hours of electricity since 1984, equivalent to powering 1 million homes for a year. The parabolic trough system was.
