

Salt-dissolved solar power plant

Overview

Molten salt is a heat transfer fluid (HTF) and thermal energy storage (TES) used in solar power plants to increase efficiency and reduce costs. Dissolved salt solar power generation is a novel approach to harnessing solar energy through the use of salt solutions. Operators can take advantage of a new ternary. Kevin Robb, a staff scientist at the Department of Energy's Oak Ridge National Laboratory, is taking what he learned from developing the Liquid Salt Test Loop—a key tool in deploying molten salt technology applications—to design a similar facility in support of Generation 3 Concentrating Solar. Four HelioTrough® collector modules with a total length of 684 metres provide a total thermal output of up to 3. Receiver tubes from project partner Rioglass are used in the collectors, which can be operated with molten salt at up to 565 degrees Celsius. The steam generator provides.
