

# The relationship between energy interconnected microgrids

## Overview

In essence, microgrid interconnection is about creating a synergistic relationship between localized energy systems and the broader power grid. This study introduces a decentralized energy management approach for interconnected microgrids that leverage renewable energy sources such as wind and solar, alongside distributed energy generators and storage mechanisms. An energy coalition manager (ECM) plays a key role in facilitating each. This chapter traces the evolutionary pathway of integrated energy microgrids: from their origins driven by the limitations of bulk power systems and the need for enhanced reliability, through a distributed transition propelled by the rise of renewable energy; to their capability enhancement and. The deployment of isolated microgrids has witnessed exponential growth globally, especially in the light of prevailing challenges faced by many larger power grids.
